

Features of new version

1. The logic of work with order and negotiated order entry forms has been changed. The order entry form window will not be closed now, if an error is received as a result of transaction processing. This allows, if required, correcting the transaction parameters and send it again.
2. The automatic substitution of a trading account in the order entry form is performed considering the settings that limit the list of available trading accounts for the client at the QUIK server.
3. The possibility to connect to the QUIK server using an address in the IPv6 format is supported.

Issues resolved

1. In some cases, an order on the instrument of the Bookbuilding Module could not be submitted.
2. The trading account was not substituted when submitting an OMS order if the **Set depo account by client code** setting was enabled.
3. The **New order** menu item was inactive in the **Trades** table.
4. An incorrect calculation of the portfolio value in the "MD+" scheme when currencies are included in sets of instruments with dependent prices.
5. An incorrect color marking of trades for execution.
6. An incorrect display of orders in the chart window after deleting the price chart.
7. An incorrect display of text on the "Horizontal ray" figure when the chart scale is changed along the vertical axis.
