Features of new version

1. The ability to specify fractional quantity when creating algo orders has been supported.
2. Transmission of date and time of risk rate changes in the **Market risk parameters** table and **Relative risk rates** table has been supported.
3. The field to specify visible part of an order has been added on the Iceberg REPO with CCP order entry form.

Issues resolved

1. A synchronization error that could cause the program to crash while calculating data for the **Account state** table and **Buy/Sell** table.
2. Incorrect calculation of the change in collateral, resulting in the incorrect generation of closing orders within the CoLibri risk manager terminal module.
3. When opening the **Information on instrument**, the window size was determined without taking into account the font sizes specified in the settings.
4. Scroll bars could be displayed incorrectly in the **Information on instrument** window.
5. An incorrect face value was displayed in the **Information on instrument** window for indexed bonds.
